# Preface

## The International Energy Agency

The International Energy Agency (IEA) was established in 1974 within the framework of the Organisation for Economic Co-operation and Development (OECD) to implement an international energy programme. A basic aim of the IEA is to foster international co-operation among the 28 IEA participating countries and to increase energy security through energy research, development and demonstration in the fields of technologies for energy efficiency and renewable energy sources.

## The IEA Energy in Buildings and Communities Programme

The IEA co-ordinates research and development in a number of areas related to energy. The mission of the Energy in Buildings and Communities (EBC) Programme is to develop and facilitate the integration of technologies and processes for energy efficiency and conservation into healthy, low emission, and sustainable buildings and communities, through innovation and research. (Until March 2013, the IEA-EBC Programme was known as the Energy in Buildings and Community Systems Programme, ECBCS.)

The research and development strategies of the IEA-EBC Programme are derived from research drivers, national programmes within IEA countries, and the IEA Future Buildings Forum Think Tank Workshops. The research and development (R&D) strategies of IEA-EBC aim to exploit technological opportunities to save energy in the buildings sector, and to remove technical obstacles to market penetration of new energy efficient technologies. The R&D strategies apply to residential, commercial, office buildings and community systems, and will impact the building industry in five focus areas for R&D activities:

- Integrated planning and building design
- Building energy systems
- Building envelope
- Community scale methods
- Real building energy use

## The Executive Committee

Overall control of the IEA-EBC Programme is maintained by an Executive Committee, which not only monitors existing projects, but also identifies new strategic areas in which collaborative efforts may be beneficial. As the Programme is based on a contract with the IEA, the projects are legally established as Annexes to the IEA-EBC Implementing Agreement. At the present time, the following projects have been initiated by the IEA-EBC Executive Committee, with completed projects identified by (\*):

- Annex 1: Load Energy Determination of Buildings (\*)
- Annex 2: Ekistics and Advanced Community Energy Systems (\*)
- Annex 3: Energy Conservation in Residential Buildings (\*)
- Annex 4: Glasgow Commercial Building Monitoring (\*)
- Annex 5: Air Infiltration and Ventilation Centre
- Annex 6: Energy Systems and Design of Communities (\*)
- Annex 7: Local Government Energy Planning (\*)
- Annex 8: Inhabitants Behaviour with Regard to Ventilation (\*)
- Annex 9: Minimum Ventilation Rates (\*)
- Annex 10: Building HVAC System Simulation (\*)
- Annex 11: Energy Auditing (\*)
- Annex 12: Windows and Fenestration (\*)
- Annex 13: Energy Management in Hospitals (\*)
- Annex 14: Condensation and Energy (\*)
- Annex 15: Energy Efficiency in Schools (\*)
- Annex 16: BEMS 1- User Interfaces and System Integration (\*)
- Annex 17: BEMS 2- Evaluation and Emulation Techniques (\*)
- Annex 18: Demand Controlled Ventilation Systems (\*)

Annex 19: Low Slope Roof Systems (\*)  
Annex 20: Air Flow Patterns within Buildings (\*)  
Annex 21: Thermal Modelling (\*)  
Annex 22: Energy Efficient Communities (\*)  
Annex 23: Multi Zone Air Flow Modelling (COMIS) (\*)  
Annex 24: Heat, Air and Moisture Transfer in Envelopes (\*)  
Annex 25: Real time HVAC Simulation (\*)  
Annex 26: Energy Efficient Ventilation of Large Enclosures (\*)  
Annex 27: Evaluation and Demonstration of Domestic Ventilation Systems (\*)  
Annex 28: Low Energy Cooling Systems (\*)  
Annex 29: Daylight in Buildings (\*)  
Annex 30: Bringing Simulation to Application (\*)  
Annex 31: Energy-Related Environmental Impact of Buildings (\*)  
Annex 32: Integral Building Envelope Performance Assessment (\*)  
Annex 33: Advanced Local Energy Planning (\*)  
Annex 34: Computer-Aided Evaluation of HVAC System Performance (\*)  
Annex 35: Design of Energy Efficient Hybrid Ventilation (HYBVENT) (\*)  
Annex 36: Retrofitting of Educational Buildings (\*)  
Annex 37: Low Exergy Systems for Heating and Cooling of Buildings (LowEx) (\*)  
Annex 38: Solar Sustainable Housing (\*)  
Annex 39: High Performance Insulation Systems (\*)  
Annex 40: Building Commissioning to Improve Energy Performance (\*)  
Annex 41: Whole Building Heat, Air and Moisture Response (MOIST-ENG) (\*)  
Annex 42: The Simulation of Building-Integrated Fuel Cell and Other Cogeneration Systems (FC+COGEN-SIM) (\*)  
Annex 43: Testing and Validation of Building Energy Simulation Tools (\*)  
Annex 44: Integrating Environmentally Responsive Elements in Buildings (\*)  
Annex 45: Energy Efficient Electric Lighting for Buildings (\*)  
Annex 46: Holistic Assessment Tool-kit on Energy Efficient Retrofit Measures for Government Buildings (EnERGo) (\*)  
Annex 47: Cost-Effective Commissioning for Existing and Low Energy Buildings (\*)  
Annex 48: Heat Pumping and Reversible Air Conditioning (\*)  
Annex 49: Low Exergy Systems for High Performance Buildings and Communities (\*)  
Annex 50: Prefabricated Systems for Low Energy Renovation of Residential Buildings (\*)  
Annex 51: Energy Efficient Communities (\*)  
Annex 52: Towards Net Zero Energy Solar Buildings  
Annex 53: Total Energy Use in Buildings: Analysis & Evaluation Methods (\*)  
Annex 54: Integration of Micro-Generation & Related Energy Technologies in Buildings  
Annex 55: Reliability of Energy Efficient Building Retrofitting - Probability Assessment of Performance & Cost (RAP-RETRO)  
Annex 56: Cost Effective Energy & CO2 Emissions Optimization in Building Renovation  
Annex 57: Evaluation of Embodied Energy & CO2 Emissions for Building Construction  
Annex 58: Reliable Building Energy Performance Characterisation Based on Full Scale Dynamic Measurements  
Annex 59: High Temperature Cooling & Low Temperature Heating in Buildings  
Annex 60: New Generation Computational Tools for Building & Community Energy Systems  
Annex 61: Business and Technical Concepts for Deep Energy Retrofit of Public Buildings  
Annex 62: Ventilative Cooling  
Annex 63: Implementation of Energy Strategies in Communities  
Annex 64: LowEx Communities - Optimised Performance of Energy Supply Systems with Energy Principles  
Annex 65: Long-Term Performance of Super-Insulation in Building Components and Systems  
Annex 66: Definition and Simulation of Occupant Behaviour in Buildings  
Annex 67: Energy Flexible Buildings  
Annex 68: Design and Operational strategies for High IAQ in Low Energy Buildings  
Annex 69: Strategy and Practice of Adaptive Thermal Comfort in low Energy Buildings  
Annex 70: Building Energy Epidemiology  
Annex 71: Building energy performance assessment based on in-situ measurements  
Annex 72: Assessing Life Cycle related Environmental Impacts Caused by Buildings

Annex 73: Towards Net Zero Energy Public Communities

Annex 74: Energy Endeavour

Annex 75 Cost-effective building renovation at district level combining energy efficiency and renewables

Working Group - Energy Efficiency in Educational Buildings (\*)

Working Group - Indicators of Energy Efficiency in Cold Climate Buildings (\*)

Working Group - Annex 36 Extension: The Energy Concept Adviser (\*)

Working Group - Survey on HVAC Energy Calculation Methodologies for Non-residential Buildings

## Table of content

1.	Introduction	1
2.	Structure	1
3.	Dictionary	2
4.	Terms and Definitions	11
5.	Legal and normative framework conditions	13
6.	National indicators	16
7.	Conversion factors	44

# 1. Introduction

When several partners from different countries work together on one common topic, often the problem arises that basically all people talk about the same topic but in detail often country-specific basic conditions are different. For example, in some countries the energy-related surface for the energy performance calculation is the gross floor area, in other countries it is the net floor area and other countries again choose other surface areas.

To form a uniform basis for all further work in the IEA EBC Annex 56, country-related terms and definitions, normative and legal framework conditions as well as different national indicators were collected for each country.

This report comprises the result of the joint coordination works and should serve as a basis for a common understanding.

# 2. Structure

The report is divided in four main parts:

- Chapter 3 includes at the very beginning a list of several technical terms and their translation into Czech, Danish, French, German, Italian, Dutch, Finnish, Norwegian, Portuguese, Spanish and Swedish. This chapter serves therefore quasi as a dictionary for specific technical terms.
- Chapter 4 contains important terms and definitions to the topic briefly described.
- In chapter 5 some information about the different framework conditions in the partner countries can be found. So it is noted how the “major renovation” is defined in each country, which legal requirements have to be fulfilled and also how the subsidies for the building renovation are defined.
- Chapter 6 includes further information about national definitions and methods, such as details about the different reference surfaces, energy flows, energy balances and the used balance boundaries. In chapter 7 conversion factors in each partner country are listed.

### 3. Dictionary

English	Czech	Danish	Dutch	Finnish	French	German	Italian	Norwegian	Portuguese	Spanish	Swedish
air change rate	Intenzity výměny vzduchu	luftskifte	luchtversingsnelheid	ilmanvaihtuvuus	taux (m) de renouvellement (m) d'air	Luftwechselrate (f)	tasso di ricambio	luftskifte	taxa de renovação de ar	ratio de renovación de aire	luftomsättning

## 4. Terms and Definitions

Term	Definition
Carbon Dioxide Equivalent (CO <sub>2eq</sub> )	A simple way to place emissions of various climate change agents on a common footing to account for their effect on climate. It describes, for a given mixture and amount of greenhouse gas, the equivalent weight of carbon dioxide that would have the same global warming ability, when measured over a specified timescale. For the purpose of this report, greenhouse gas emissions (unless otherwise specified) are the sum of the basket of greenhouse gases listed in this glossary under the entry: "Greenhouse Gases covered by the Kyoto Protocol"
Global Warming Potential (GWP)	A relative index that enables comparison of the climate effect of the emissions of various greenhouse gases (and other climate changing agents). Carbon dioxide, the greenhouse gas that causes the greatest radiative forcing because of its overwhelming abundance, is chosen as the reference gas.
Greenhouse Gases covered by the Kyoto Protocol	Include the six main greenhouse gases, as listed in Annex A of the Kyoto Protocol: Carbon dioxide (CO <sub>2</sub> ); Methane (CH <sub>4</sub> ); Nitrous oxide (N <sub>2</sub> O); Hydrofluorocarbons (HFCs); Perfluorocarbons (PFCs); and Sulphur hexafluoride (SF <sub>6</sub> ).
Kyoto Protocol	The international environmental treaty intended to reduce greenhouse gas emissions. It adds additional provisions to the United Nations Framework Convention on Climate Change.
Montreal Protocol	The multilateral environmental agreement dealing with the depletion of the earth's ozone layer.
Primary energy	Energy that has not been subjected to any conversion or transformation process. Primary energy includes non-renewable energy and renewable energy. If both are taken into account it can be called total primary energy.  For a building, it is the energy used to produce the energy delivered to the building. It is calculated from the delivered and exported amounts of energy carriers, using conversion factors.
Thermal envelope	Shell of the building as barrier to the loss of the interior heat or to the penetration of unwanted outside heat into the building. It refers to the walls, windows, roof and basement floor of the building.
U value	Measure of the envelope's component energy performance [W/(m <sup>2</sup> K)]; how low is this value, better is the component's energy performance. Many Countries impose the U values for new constructions or for refurbishments. The U value can be obtained both for opaque components and for windows.
Boiler efficiency	The ratio of heat absorbed in steam/ water to the heat supplied in fuel, usually measured in percent.
COP	The steady-state performance of an electric compression heat pump at a given set of temperature conditions is referred to as the coefficient of performance (COP). It is defined as the ratio of heat delivered by the heat pump and the electricity supplied to the compressor.
EER	The Energy Efficiency Ratio (EER) of a particular cooling device is the ratio of output cooling to input electrical power at a given operating point.
Cogeneration	Simultaneous generation in one process of thermal energy and electrical or mechanical energy
System thermal loss	Thermal loss from a technical building system for heating, cooling, domestic hot water, humidification, dehumidification or ventilation that does not contribute to the useful output of the system
Energy source	Source from which useful energy can be extracted or recovered either directly or by means of a conversion or transformation process. Examples include oil or gas fields, coal mines, sun, forests etc.
Energy carrier	Substance or phenomenon that can be used to produce mechanical work or heat or to operate chemical or physical processes.

<b>Renewable energy</b>	Energy from sources that are not depleted by extraction, such as solar energy (thermal and photovoltaic), wind, water power, renewed biomass.
<b>Non-renewable energy</b>	Energy taken from a source which is depleted by extraction (e.g. fossil fuels)
<b>LCIA – Life Cycle Impact Assessment</b>	Phase of Life Cycle Assessment aimed at understanding and evaluating the magnitude and significance of the potential environmental impacts of a product system” (ISO 14044:2006). Impact assessment should address ecological and human health effects; it should also address resource depletion.
<b>Embodied Energy</b>	Embodied energy is defined as the total energy inputs consumed throughout a product’s life-cycle. Initial embodied energy represents energy used for the extraction of raw materials, transportation to factory, processing and manufacturing, transportation to site, and construction. Once the material is installed, recurring embodied energy represents the energy used to maintain, replace, and recycle materials and components of a building throughout its life. One fundamental purpose for measuring this quantity is to compare the amount of energy produced or saved by the product in question to the amount of energy consumed in producing it.

## 5. Legal and normative framework conditions

Renovation-related definitions	
<b>Country</b>	<b>Austria</b>
<i>"Major renovation"</i>	Renovation that concerns more than 25% of the building envelope, unless the total investment for the renovation (envelope and technical value).
<i>Legal requirements</i>	Max. HD (heating demand) referring to the reference climate below: <b>25 x (1 + 2,5 / I<sub>c</sub>)</b> but not more than <b>87,5 kWh/m<sup>2</sup>a</b> . Mandatory target U-values for the building components; mandatory high-efficient energy supply systems based on "alternative energy sources";
<i>Subsidies</i>	Several subsidy programmes by the federal government, federal provinces or municipalities; generally two main aspects are addressed: Subsidies related to the object (building renovation itself-gained by the building owner) or subsidies related to the subject (occupant/ tenant acc. to his/her monthly income or financial situation)
<b>Country</b>	<b>Czech Republic</b>
<i>"Major renovation"</i>	"Major renovation" defined in decree 78/2013 par. 6 as a change in more or equal 25% of gross floor area (GFA).
<b>Country</b>	<b>Denmark</b>
<i>"Major renovation"</i>	No definition of "major renovation" any more in DK, we have only renovation requirements on component level
<i>Legal requirements</i>	The renovation should be economically sound ((lifetime x yearly savings)/ investments >1.33)
<i>Subsidies</i>	It is possible for the house owner to subtract 15.000 DKK in his income for each person above 18 years living in the house – however max 30.000 DKK per household per year.
<b>Country</b>	<b>Finland</b>
<i>"Major renovation"</i>	No definition of a "Major renovation". But any alteration that effects the outward appearance or my effect safety or health conditions of users have to apply for a building permit.
<i>Legal requirements</i>	The "Land Use and Building Act" defines requirements for building permits and for repair works; ( <a href="http://www.finlex.fi/en/laki/kaannokset/1999/19990132">http://www.finlex.fi/en/laki/kaannokset/1999/19990132</a> )
<i>Subsidies</i>	Repair and energy grants ( <a href="http://www.ara.fi/default.asp?node=692&amp;lan=en">http://www.ara.fi/default.asp?node=692&amp;lan=en</a> ) Within an approved authorization in the State Budget, repair and energy grants can be made by The Housing Finance and Development Centre of Finland for improvements in the condition and quality of individual apartments and apartment buildings Energy grants ( <a href="http://www.ara.fi/default.asp?node=692&amp;lan=en">http://www.ara.fi/default.asp?node=692&amp;lan=en</a> ) The purpose of the grants is to improve the energy economy of residential buildings. Grants are aimed at reducing both energy consumption and emissions of greenhouse gases. Grants are awarded for conducting independent energy audits, for external repair work to as defined in legislation, for improving the ventilation and heating systems, and for implementing renewable energy sources. The grant covers up to 25 % of the approved costs. Grants are awarded by the local authority
<b>Country</b>	<b>Italy</b>
<i>"Major renovation"</i>	Definitions as in D.Lgs.192/2005, D.Lgs.311/2006 and DPR 59/2009.
<i>Legal requirements</i>	Energy performances requirements are requested 1) for the whole building if the Net Floor Area is greater than 1000 m <sup>2</sup>

	<p>1a) for a complete renovation of the building envelope and</p> <p>1b) in the case of extraordinary repairs for building demolition and building reconstruction;</p> <p>2) for the enlarged portion of the building if the enlarged Volume is greater than 20% of the original one;</p> <p>3) for specific parts or elements as thermal systems (boiler replacement), envelope components (windows)</p>
<i>Subsidies</i>	National subsidy program for upgrading to more efficient buildings have been proposed starting 2007 until 2012: 55% of the global costs could be financed if the operations are performed following regulations of the Government Decreets.
<b>Country</b>	<b>Norway</b>
<i>"Major renovation"</i>	Not defined properly.
<i>Legal requirements</i>	Requirements are the same as the requirements for new buildings.
<i>Subsidies</i>	National subsidy program for upgrading to low-energy or Norwegian passive house standard.
<b>Country</b>	<b>Portugal</b>
<i>"Major renovation"</i>	A major renovation is a renovation which exceeds 25% of building value (calculated based on a reference value for square meter and by type of building set annually by decree)
<i>Legal requirements</i>	If it is a major renovation the regulation requires compliance with existing energy use requirements.
<i>Subsidies</i>	<i>No subsidies</i>
<b>Country</b>	<b>Spain</b>
<i>"Major renovation"</i>	Not defined properly. When intervening in existing buildings, there are three circumstances under which the intervention or those components modified must comply with the existing regulation on the "Limitation of the energy demand".
<i>Legal requirements</i>	<p>1) When the intervention produces changes in internal or external conditions of an element of the thermal envelope that lead to an increase in energy demand of the building, the features of this element must fulfill the requirements set out in the section "Limitation of the energy demand"</p> <p>2) In the renovations where more than 25% of the total area of the thermal envelope of the building is renewed and in those renovations where the characteristic use of the building is changed the energy demand of the building will be limited so that it is less than the reference building (same building with the thermal performance of the components of the envelope set by the regulation).</p> <p>3) In other renovations not considered in the previous cases, the elements of the thermal envelope that are substantially replaced, incorporated or modified must comply with the limitations of maximum thermal transmittance and air permeability established in the regulations depending on the climate zone. When several elements of the thermal envelope are simultaneously modified, these thermal transmittance values may be overtaken if the resulting energy demand is equal to or lower than that obtained by applying the values of the regulation to these elements.</p>
<i>Subsidies</i>	<i>National subsidy program for measures on the building envelope and loan for the improvement of energy efficiency of thermal systems and lighting of the replacement of heating/cooling systems with conventional energy by biomass or geothermal energy. Regional subsidies and loans for energy efficiency improvements.</i>
<b>Country</b>	<b>Switzerland</b>
<i>"Major renovation"</i>	A major renovation is a renovation which either exceeds 25% of building value (value of the building assurance) or 200'000 CHF (ca. 165'000 €)
<i>Legal requirements</i>	If it is a major renovation the building permit requires that compliance with existing energy use requirements is certified. Verification can be done by single building parts or an overall calculation of energy needs of the building which is renovated. The requirements depend on the ration of envelope area and heated area. Requirements correspond to the requirements for new building x 1.25 (125%).
<i>Subsidies</i>	Federal subsidy program for measures on the building envelope, cantonal and sometimes additional communal programs for heating systems and renewables as well as for complying with the Minergie Standards.
<b>Country</b>	<b>Sweden</b>
<i>"Major renovation"</i>	No definition of "major renovation" in Sweden

---

*Legal requirements*

In principle the energy requirements of the current building code have to be fulfilled for a renovation, but the renovation should be economically sound and features of interest to preserve architecturally and historically have to be considered.

---

*Subsidies*

---

## 6. National indicators

Building (construction)-related indicators	
<b>Net Floor Area (conditioned) – NFA [m<sup>2</sup>]</b>	<b>Total conditioned floor area inside the building envelope excluding the external and internal walls and vents, shafts, stairs, (unoccupied) attics, basements, garages; The area is not reduced by partition walls or other moveable furnishing.</b>
<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	OIB RL 6 / Pkt. 2.6, ÖNorm B1800 “Determination of areas and volumes of buildings” / ÖNorm B8110-6 “Thermal insulation in building construction. Principles and verification methods – Heating demand and cooling demand.” Annex B – Calculation of the partition of gross floor area and gross volume within attics
<b>Country</b>	<b>Denmark</b>
<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES
<i>Remark</i>	Used for expressing the living area, not to determine energy consumption
<b>Country</b>	<b>Italy</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	UNI/TS 11300-1, Energy performance of buildings
<i>Remarks</i>	Part 1: Evaluation of energy need for space heating and cooling
<b>Country</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	“NTA”, NS 3940, area inside the building envelope excluding the external and internal construction walls
<b>Country</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. n° 118/2013 de 20 de agosto “Regulamento de Desempenho Energético dos Edifícios de Habitação (REH)” Portuguese definition includes unmoveable closets and excludes partition walls.
<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (Swedish Building Code BBR)
<i>Remarks</i>	It is a measure of floor area, measured in square meters, in temperature-controlled areas that are intended to be heated to more than 10 degrees, and bounded by the inside of the building envelope. There is also a definition according to SS 02 10 53, which is not used very often in connection with energy use. The SS excludes staircases etc.
<b>Country</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES but as “Net Floor Area (conditioned and unconditioned)”

<i>Reference</i>	Norm SIA 416 "Areas and Volumes of Buildings and Installations"
<i>Remarks</i>	Definition is slightly different: Net Floor Area comprises total conditioned and not conditioned floor area inside the building envelope excluding the external and internal construction walls (towards internal court yards) but includes internal walls dividing rooms, vents, shafts, stairs, (unoccupied) attics, basements, internal garages; The area is not reduced by partition walls or other moveable furnishing.
<i>Suggestion for modification of the definition</i>	For energy purposes in Switzerland the notion "Heated Net Floor area" ("Energiebezugsfläche") corresponding to the heated part of net floor area is commonly used (heated area with a room height of less than 1 meter is excluded). Heated net floor area is about 85% of net floor area

**Gross Floor Area (conditioned) – GFA [m<sup>2</sup>]** Sum of the covered area of all conditioned floors of a building measured outside the thermal envelope (e.g. exterior wall). Unconditioned rooms within the conditioned envelope are counted; Unoccupied, unheated basements, attics, garages outside the thermal envelope are excluded;

**Country** **Austria**

*Applicability in your country* YES See „Net Floor Area“

*Reference* ÖNorm B1800; ÖNorm B8110-6 (that is relevant for the energy indicators).

*Remarks* The ÖNorm B8110-6 excludes all spaces in conditioned attics that are below 1,50 m room height and the area of stairwells above 2m<sup>2</sup>

**Country** **Czech Republic**

*Applicability in your country* YES

*Reference* Total conditioned floor area inside the building envelope including the external and internal walls. Acc. to Czech decree 318/2012 Coll., par 2, r); defined as „energeticky vztazna plocha“.

**Country** **Denmark**

*Applicability in your country* YES  
Total conditioned floor area inside the building envelope including the external and internal walls. Danish Building code (BR10) Appendix 1

**Country** **Finland**

*Applicability in your country* YES

**Country** **Italy**

*Applicability in your country* NO

*Reference* See „Net Floor Area“

**Country** **Norway**

*Applicability in your country* YES

*Reference* "BTA" Defined in NS 3940. Comprising all areas within the building, conditioned and not conditioned. Excludes all spaces in conditioned attics that are below 1,50 m room height.

**Country** **Portugal**

*Applicability in your country* YES

*Reference* D.R. nº 9/2009 de 29 de Maio "Conceitos técnicos nos domínios do ordenamento do território e do urbanismo a utilizar pelos instrumentos de gestão territorial"

*Remarks* Portuguese definition is only used in connection with town planning regulations. Includes on each floor, the thickness of the external walls, the covered circulation spaces (atria, galleries, corridors, stairwells and elevator boxes) and the covered outdoor spaces (porches, sheds, balconies and covered terraces).

<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	SS 02 10 53
<i>Remarks</i>	Excludes opening in light well, other opening in floor structure than hole for stairs/ramp
<b>Country:</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES but as Gross Floor Area, comprising all areas within the building, conditioned and not conditioned (including exterior walls and unconditioned areas inside the building envelope but outside the thermal envelope).
<i>Reference</i>	Norm SIA 416 "Areas and Volumes of Buildings and Installations"
<b>Net Gross Area – NGA [m<sup>2</sup>]</b>	<b>Floor dimensions measured between the inner surfaces of external or party walls, disregarding any internal wall. Perimeter wall thickness, external projections, balconies and unconditioned spaces (clearly divided) is excluded.</b>
<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	NGA is defined in the Czech standard CSN EN ISO 13789
<b>Country</b>	<b>Denmark</b>

<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. nº 118/2013 de 20 de agosto "Regulamento de Desempenho Energético dos Edifícios de Habitação (REH)"
<i>Remarks</i>	In Portugal the ratio is between the envelope area (external and internal) to the conditioned net volume.
<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	Not really defined by the regulation but generally known.
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	Discussed for low energy buildings
<b>Country</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES as ration of Thermal Envelope Area to Heated Area as defined above
<i>Reference</i>	Norm SIA 380/1:2009 "Thermal Energy in Buildings"

#### Basic energy-related indicators

**Delivered Energy (EN 15603:2008) – DE [kWh]**      **Energy that is delivered to the technical building system as thermal (heating, cooling) or electric energy (splitted by energy carriers). The delivered energy is measured at the interface to the building itself.**

<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	OIB guideline no. 6
<i>Remarks</i>	Yet the delivered energy for residential buildings considers: Heating, DHW, auxiliary By Oct. 2011 the revised version of the OIB guideline no. 6 was published: therein the delivered energy considers: Heating, DHW, auxiliary and household The amount of energy from the household is counted by 50% of internal heat gain arising from persons, appliances in case of heating)
<b>Country</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Acc. to Czech decree 78/2013 (par. 4.1)
<b>Country</b>	<b>Denmark</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Calculation program Be10 (Guidelines 213 Energy Demand of Buildings)
<i>Remarks</i>	The calculation program Be10 calculates the net energy demands and the gross energy demand of a building divided in primary energy to electricity and primary energy for heating
<b>Country</b>	<b>Finland</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	Consumed energy is measured.
<b>Country</b>	<b>Italy</b>

<i>Applicability in your country</i>	YES
<i>Reference</i>	UNI/TS 11300-1: Energy performance of buildings Part 1: Evaluation of energy need for space heating and cooling DPR 59/2009 for cooling energy of buildings and D.Lgs. 192/2005 and D.Lgs. 311/2006
<b>Country</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Defined in NS 3031. Housing: Heating, DHW, auxiliary, lighting and household Non-residential: Heating, cooling, DHW, auxiliary, lighting and technical devices
<b>Country</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. n.º 118/2013 de 20 de agosto "Regulamento de Desempenho Energético dos Edifícios de Habitação (REH)"
<i>Remarks</i>	The energy provided to users in different forms (electricity, natural gas, propane or butane, biomass, etc..) and expressed in commercial significant units (Kwh, m <sup>3</sup> , Kg, ...)
<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (Swedish Building Code BBR)
<i>Remarks</i>	The energy that, in normal use, during a normal year is delivered to a building (often referred to as purchased energy) for heating, comfort cooling, hot water and facility electricity.
<b>Country</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Norm SIA 2031"Energieausweis für Gebäude (Energy Certificates for Buildings)
<i>Remarks</i>	Often used notion: "Final Energy" = across building perimeter delivered energy and on site produced and used energy
<b>Primary Energy – PE [kWh<sub>PE</sub>]</b>	According to the EN 15603 the primary energy indicates the total amount of energy for the extraction of the energy carrier, the transformation and the transport to the site where it is used. That includes efforts concerning processing, storage, generation, transmission, distribution and delivery. Optionally disposal can be addressed as well. The primary energy can be separated into a non-renewable (PE <sub>r</sub> ) or renewable part (PE <sub>n.r.</sub> ).
<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Primary energy conversion factors that are used are taken from: GEMIS, EN 15603, PHPP
<i>Remarks</i>	Since October 2011 the OIB – guideline 6 offers conversion factors that have to be used for the energy performance certificate. They will come into effect in each of the 9 provinces not until the change of the law or enactments is conducted.
<b>Country</b>	<b>Czech Republic</b>

<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Not used as reference in common, but benchmarks were used by experts.
<b>Country</b>	<b>Portugal</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	In Portuguese Building Certification System a factor of 0,0012 is used to convert Primary Energy (Kgep) in CO2 emissions
<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	Correct definition of the reference situation (anyhow measures) for determining energy and GHG-related costs is crucial. In Switzerland empirical costs often comprise VAT (8%)
<b>Heating Degree Days – HDD [Kd/a]</b>	Indicator for heating demand related to the climate of the building location. The adding of the differences between each day's mean temperature and a base temperature above which a building is assumed to be heated within the heating period. In many countries) the indoor temperature considers a contribution of average internal heat gains about 3°C.
<b>Country</b>	<b>Austria, Switzerland, Liechtenstein</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	HDD <sub>12/20</sub>
<i>Remarks</i>	Heating limit is fixed at 12°C, the indoor temperature is fixed at 20°C (HGT 20/12)
<b>Country</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Heating limit is fixed at 12°C, the indoor temperature is fixed at 20°C for residential buildings according to the Czech standard CSN EN ISO 15927- Part 6 Accumulated temperature differences (degree days) (ISO 15927-6:2007).
<b>Country</b>	<b>Denmark</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	HDD <sub>17/20</sub>
<b>Country</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Italy</b>

<i>Applicability in your country</i>	YES
<i>Remarks</i>	HDD are used for Italian Climatic zones definition
<b>Country</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	HDD (Energigradtall/ Heizgradtage, nicht Gradtagszahl). Difference between average day temperature and 17°C. Heating limit is fixed at 17°C. The mean daily temperature is calculated based on the Köppen formula.
<i>Remarks</i>	Meteorologisk institutt, Bjørn Aune
<b>Country</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. nº 118/2013 de 20 de agosto “Regulamento de Desempenho Energético dos Edifícios de Habitação (REH)”
<i>Remarks</i>	Base temperature is 18°C. No contribution from internal gains is here considered.
<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Thechnical Guide “Condiciones climáticas exteriores de proyecto”. IDAE
<i>Remarks</i>	HDD <sub>20/20</sub> and HDD <sub>15/15</sub> . There have been set for all the Spanish cities but they aren't commonly used anymore for heating demand calculation.
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Swedish Meteorological and Hydrological Institute
<i>Remarks</i>	Heating limit is fixed at diurnal average 12°C for April and September, 11 °C for August, 10 °C for May-July, 13 °C for October, the indoor temperature is fixed at 17 °C (17 °C to 20 °C is internal gains)
<b>Cooling degree days - CDD</b>	Indicator for the cooling demand related to the climate of the building location. The adding of the differences between the outside air temperature (that was higher than a specific base temperature) and a base temperature (requested indoor temperature limit) is assumed to be cooled within the cooling period.
<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	ÖNorm B8110-3 “Thermal protection in building construction – Heat storage and solar impact”;
<i>Remarks</i>	The prevention of overheating (by passive measures like inertia, shading devices and night ventilation) is mandatory for all residential buildings – that implies that residential buildings may not be cooled actively. The verification has to be done according to the ÖNorm B8110-3
<b>Country</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	NO
<b>Country</b>	<b>Denmark</b>
<i>Applicability in your country</i>	NO

<i>Applicability in your country</i>	YES
<b>Energy-flow-related indicators</b>	
<b>Energy need for heating or cooling – [kWh/m<sup>2</sup>x]</b>	<b>Heat to be delivered to, or extracted from a conditioned space to maintain the intended temperature conditions during a given period.</b>
<b>Country - [kWh/m<sup>2</sup>GFA]</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	ÖNorm H 5056 "Energy performance of buildings – Energy use for heating systems" ÖNorm H 5058 "Energy performance of buildings – Energy use for cooling systems" ÖNorm B 8110-6 "Thermal insulation in building construction - Part 6: Principles and verification methods - Heating demand and cooling demand" OIB guideline no.6 Reference area for performance indicator: Gross Floor Area (GFA)
<i>Remarks</i>	Energy needs for heating are determined taking into account interior heat sources and passive solar gains (taking into account shading effects of systems and neighbored built environment). The building design and adequate passive measures have to guarantee that overheating will not occur during building operation. Therefore <u>no</u> cooling demand is calculated for residential buildings.
<b>Country - [kWh/m<sup>2</sup>GFA]</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES

<i>Remarks</i>	Energy consumed for lighting purposes is only directly considered in non-residential buildings. In residential buildings lighting energy consumption is not considered, being only estimated the internal load resulting from the lighting devices
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Spain</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	Energy consumed for lighting purposes is only directly considered in non-residential buildings. In residential buildings lighting energy consumption is not considered, only the heat internal gain resulting from the lighting devices is fixed by the normative to calculate the heating demand.
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Sweden</b>

<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (Swedish Building Code BBR) Reference area for performance indicator: Net Floor ( <b>NFA</b> )
<i>Remarks</i>	No specific requirement on fixed lighting, but included in the energy requirement
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES <i>Electric energy for lighting: Calculation and requirements for different zones of building use in the building</i>
<i>Reference</i>	Norm SIA 380/4 "Electrical Energy in Buildings" Reference area for performance indicator: Net Floor ( <b>NFA</b> )
<b>Energy need for ventilation - [kWh/m<sup>2</sup><sub>x</sub>]</b>	<b>Electric energy to be delivered the operation of a ventilation system for air transport (not included energy input for pre-heating or pre-cooling the air) and energy input to a humidification system.</b>
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES but only considered for non-residential buildings;
<i>Reference</i>	ÖNorm H 5057 "Energy performance of buildings – energy use for ventilation systems of residential and non-residential buildings" Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<i>Remarks</i>	The energy performance certificate for residential buildings does not take the energy need for ventilation into account.
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Denmark</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	The calculation program Be10: Guidelines 213 Energy Demand of Buildings Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES and NO
<i>Remarks</i>	Heating losses due to ventilation are calculated in the design phase, does not refer to electrical energy need for ventilation
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Italy</b>
<i>Applicability in your country</i>	NO
<b>Country - [kWh/m<sup>2</sup><sub>NGA</sub>]</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Reference area for performance indicator: Net Gross Area ( <b>NGA</b> )
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. nº 118/2013 de 20 de agosto "Regulamento de Desempenho Energético dos Edifícios de Habitação (REH)"; Reference area for performance indicator: Net Floor ( <b>NFA</b> )

<i>Remarks</i>	The electrical power required for the functioning of mechanical ventilation systems is considered to calculate the total energy use.
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Spain</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	In order to calculate the heating demand a constant ventilation rate is assumed to guarantee the indoor air quality but it is supposed to be natural ventilation.
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (Swedish Building Code BBR) Reference area for performance indicator: Net Floor ( <b>NFA</b> )
<i>Remarks</i>	No specific requirement on electricity for ventilation, but included in the energy requirement
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	YES Electric energy for ventilation: Calculation and requirements for different zones of building use in the building
<i>Reference</i>	Norm SIA 380/4 "Electrical Energy in Buildings" Reference area for performance indicator: Net Floor ( <b>NFA</b> )
<b>Energy need for other services - [kWh/m<sup>2</sup><sub>x</sub>]</b>	<b>Electric energy need for appliances providing other services than heating, cooling, lighting, ventilation; e.g: auxiliary energy for pumps, operation of elevators, fire safety systems,..</b>
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES and NO: YES → basically auxiliary energy for pumps within the heating system and DHW preparation is considered within the energy performance certificate – it is summarized within the term "Heiztechnikenergiebedarf" (~ energy need for heating technique); this energy incorporates that amount of energy that is lost while the energy for heating is generated, stored, distributed and dissipated; the use of solar energy or heat pumps within the system lower this amount (they are integrated as "efficiency measures"); NO → Energy for elevators, fire safety systems, etc. are not incorporated anyhow
<i>Reference</i>	Same references as for "energy need for heating" Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<i>Remarks</i>	The "Heiztechnikenergiebedarf" might be seen as difference between the energy need and the final energy (losses and efficiency of system) but due to the fact that a solar thermal generated energy or energy from heat pumps lowers that value it is not transparent of the system per se is efficient or renewable generated energy lowers the demand of inefficient system or high losses.
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	NO <i>The energy for pumps and operation of building services is included in the energy need for heating and DHW. Energy for elevators, fire safety systems, etc. are not incorporated anyhow (Czech decree No 78/2013, par. 4)</i>
<i>Reference</i>	Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Denmark</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	Electricity for operating the heating, cooling, ventilation and DHW systems is included (pumps and fans etc.)
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Finland</b>

<i>Applicability in your country</i>	NO
<i>Reference</i>	Heating loads due to electrical appliances are calculated or estimated during design based on the building code
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Italy</b>
<i>Applicability in your country</i>	NO
<b>Country - [kWh/m<sup>2</sup><sub>NGA</sub>]</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Reference area for performance indicator: Net Gross Area (NGA)/
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. n° 118/2013 de 20 de agosto "Regulamento de desempenho energético dos edifícios de comércio e serviços (RECS)"" Reference area for performance indicator: Net Floor Area (NFA)
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Spain</b>
<i>Applicability in your country</i>	NO
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (Swedish Building Code BBR) Reference area for performance indicator: Net Floor (NFA)
<i>Remarks</i>	No specific requirement on electricity for other services, but included in the energy requirement
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	NO
<b>Energy need for household - [kWh/m<sup>2</sup><sub>x</sub>]</b>	<b>Electric energy that is needed within the apartments to fulfil the user's specific lifestyle.</b>
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES and NO: YES → the new draft for the OIB guideline no. 6 incorporates the household as a numerical value of 50% of the internal heat gains arising from persons and machines in case of heating (for residential buildings); NO → currently the OIB guideline no.6 is valid for the calculation of the energy performance certificate and therein it is not considered;
<i>Reference</i>	OIB guideline no 6 Reference area for performance indicator: Gross Floor Area (GFA)
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	However in Net ZEB calculations is used.
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Denmark</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	Only considered as the internal heat gains. However, included in Net ZEB calculations

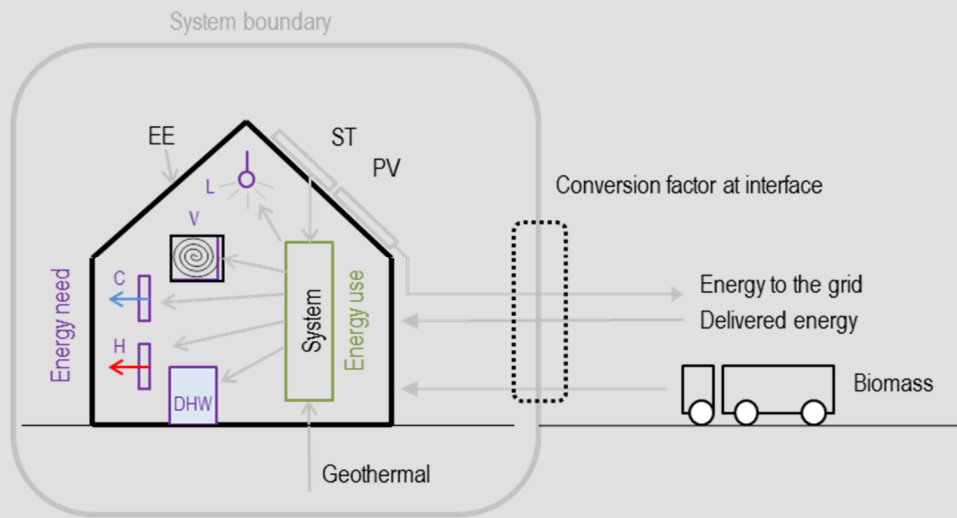

<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<i>Remarks</i>	Measured by apartment/house, estimated during the design phase
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Italy</b>
<i>Applicability in your country</i>	NO
<b>Country - [kWh/m<sup>2</sup>]</b>	<b>Norway</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	Included in "Energy need for other services".

<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (Swedish Building Code BBR) Reference area for performance indicator: Net Floor ( <b>NFA</b> )
<i>Remarks</i>	Not included in the building code requirements.
<b>Country - [kWh/m<sup>2</sup><sub>NFA</sub>]</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	NO
<b>Energy use for space heating and cooling, respectively the categories above - [kWh/m<sup>2</sup><sub>x</sub>]</b>	Energy input to the heating system to satisfy the energy need for heating or cooling; Obviously while monitoring energy use of a building and the technical building system (or energy source) serves several purposes (e.g: heating + dhw or household + lighting + ventilation) it can be difficult to split the energy use into that used for each purpose. Hence it has to be indicated as combined quantity.
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES and NO: YES → In case of projects realized with subsidies or as pilot projects within several funding programmes it is – depending on the funding scheme – mandatory to implement several monitoring, verification and energy book-keeping systems; NO → Yet buildings commonly realized within the standard are not obliged to prove their performance;
<i>Reference</i>	Reference area for performance indicator: Gross Floor Area ( <b>GFA</b> )
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Defined in Czech standard ČSN EN ISO 13790.
<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Denmark</b>
<i>Applicability in your country</i>	NO
<i>Remarks</i>	Only in demonstration projects individual monitoring is performed – else no demand for detailed monitoring. In the calculation it is possible to split up all the individual energy uses.

<b>Country - [kWh/m<sup>2</sup><sub>GFA</sub>]</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES

<i>Applicability in your country</i>	Listed above already

Energy-balance-related definitions

Energy balance

<b>System boundary</b>	The system boundary defines the range of energy flows and resources that are considered within the calculation or balance – the boundaries and the scope may differ from country to country;
<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES and NO: The energy flows considered are the delivered energy and the generated energy on-site. Thereby the term “delivery energy” will be introduced furthermore to indicate the amount of energy that is necessary to be obtained regarding the own consumption of on-site production. Scope is different (no lighting or ventilation etc. considered, generated solar thermal energy integrated as efficiency)
<b>Country</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES.
<b>Country</b>	<b>Denmark</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES and NO: A bit differently defined in the building code.
<b>Country</b>	<b>Italy</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	The Norwegian building energy labelling system is using the “delivered energy” term.
<b>Country</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	D.L. 118/2013 de 20 de agosto Regulamento de Desempenho Energético dos Edifícios de Habitação (REH) and “Regulamento de desempenho energético dos edifícios de comércio e serviços (RECS)”
<i>Remarks</i>	The boundary is the building envelope, and the energy consumption inside the building. In residential buildings is considered: heating, cooling, ventilation and domestic hot water. In non-residential buildings is also considered the internal and external lighting, as well as appliances and other equipment.

<b>Country</b>	<b>Spain</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	The boundary is the building envelope, and the energy consumption inside the building. In residential buildings is considered: heating, cooling and domestic hot water. In non-residential buildings is also considered the lighting.
<b>Country</b>	<b>Sweden</b>
<i>Applicability in your country</i>	YES
<i>Reference</i>	Boverket (building code BBR)
<i>Remarks</i>	The boundary is the building envelope. The energy use is considered which, for normal use, during a normal year is delivered to a building (often called purchased energy) for heating, comfort cooling, dhw and other energy needed for operating the building
<b>Country</b>	<b>Switzerland</b>
<i>Applicability in your country</i>	Definition is ok, corresponding to the Swiss definition of delivered energy
<b>Period of time – 1 year [a]</b>	<b>The basis for calculating the energy related figures is generally one year.</b>
<b>Country</b>	<b>Austria</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	Although the reference period of time is one year (mainly used for the energy performance certificate) the calculation methodology is monthly based.
<b>Country</b>	<b>Czech Republic</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	Although the reference period of time is one year (mainly used for the energy performance certificate and audits) the calculation methodology is monthly based for space heating.
<b>Country</b>	<b>Denmark</b>
<i>Applicability in your country</i>	YES
<i>Remarks</i>	Although the reference period of time is one year the calculation methodology is monthly based.
<b>Country</b>	<b>Finland</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Italy</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Norway</b>
<i>Applicability in your country</i>	YES
<b>Country</b>	<b>Portugal</b>
<i>Applicability in your country</i>	YES

**Key**

PE	The Primary Energy Indicator (PE) is a numerical coefficient to indicate the amount of primary energy that has to be expended to achieve usable energy at the point of delivery or interface.
PE, n.r.	The Primary Energy Indicator non renewable (PE, n.r.) indicates only the new renewable part of primary energy. This component addresses the use of fossile fuels or other non-renewable sources or pollutants. The renewable component of the primary energy is therein neglected.
PE, total	The Primary Energy Indicator total (PE, total) indicates the entire primary energy that has to be afforded to supply 1 kWh usable energy at a point of delivery or interface.
CO <sub>2</sub> Equiv	The CO <sub>2</sub> Equivalent (CO <sub>2</sub> Equiv.) is a numerical coefficient to express the amount of carbon dioxide emissions caused by the utilized energy at the point of delivery or interface. Other greenhouse gas emissions are included, expressed by "equivalent emissions".

**Remarks**

- <sup>1</sup> Electricity UCPTE Mix 1996. Values 2009: 432g/kWh
- <sup>2</sup> "Co-efficient" for CO<sub>2</sub> Production
- <sup>3</sup> Natural Gas CHP plant (70% CHP)
- <sup>4</sup> All Factors calculated with Gemis 4.5 related to German framework (power supply system + imports, etc.)
- <sup>5</sup> All Factors calculated with Gemis 4.5 related to Austrian framework (power supply system + imports, etc.)
- <sup>6</sup> Power prod. with 60% hydro, but incl. imports 50% from hydro power
- <sup>7</sup> Austrian basis of calculation differs from the German one
- <sup>9</sup> OIB guidelines represent the technical part of the Austrian building codes, valid for all 9 federal provinces, but the guideline enters into force by specific required enactment by each province (e.g: Styria scheduled by April 2012)
- <sup>10</sup> Biomass general
- <sup>11</sup> Separate verification necessary
- <sup>12</sup> "SIA Energy Efficiency Path", SIA-Merkblatt 2040, 2011
- <sup>13</sup> ESU-Services (2008): "Primary Energy Factor of Energy Systems", Version 1.1, April 30th 2008
- <sup>14</sup> Electricity mix of Swiss electricity consumption
- <sup>15</sup> District heating from waste incineration plant;
- <sup>16</sup> District heating from Gas-CHP
- <sup>17</sup> Wood heating plant
- <sup>18</sup> Oil heating plant, for Gas heating plant: PEI n.r. = 1.56, CO<sub>2</sub>equi =313.12
- <sup>19</sup> Gas cogeneration unit, block gas combined heat and power plant
- <sup>20</sup> UCTE - Mix
- <sup>21</sup> In Denmark the conversion factors used in calculations have been politically established for 2010, 2015 and 2020, i.e. the three numbers given for PEI, total. They do not include extraction and transportation.
- <sup>22</sup> The PEI, n.r. are mean values for Denmark. In reality these will vary from place to place. These include both extraction and transportation. The non-renewable part of the primary energy indicator for electricity will vary over time and with region, therefore it is difficult to describe it in a single number.
- <sup>23</sup> The CO<sub>2</sub> Equiv. are mean values for Denmark. In reality these will vary from place to place. These include
- <sup>24</sup> Not including extraction and transportation.
- <sup>25</sup> Primary energy factors have to be used in energy calculations for non-residential buildings. NS-EN 15603, E can be used. National primary energy factors and CO<sub>2</sub> equiv. are not adopted.
- <sup>26</sup> All factors in accordance with DL 79 and 80/2006. These values are expected to change with the new building regulations (mid 2012)
- <sup>27</sup> Wood and wood pellets are considered as renewable energy sources, without GHG emissions
- <sup>28</sup> Despacho nº 14076/2010 (These conversion factors are only used for the network of production and distribution of cold and heat of Climaespaço, Parque das Nações, based on the technology of trigeneration)
- <sup>29</sup> E-value = energy bought (delivered) to the building \* factor for the energy source
- <sup>30</sup> Fossile fuels in general
- <sup>31</sup> Factor valid for delivered energy from district heating in general
- <sup>32</sup> Factor valid for delivered energy from district cooling in general
- <sup>33</sup> CALENER, software for certification of energy efficiency in buildings.
